Cotton Varieties Planted, United States 1963-1967

Estimates of the percentages of the various varieties of cotton planted in the United States in 1967, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1963-1966 are shown by states. A preliminary report containing percentage distributions of cotton varieties planted by counties and cotton classing office territories in the early harvesting area of south Texas was published in mid-June.

The variety data presented herein are based principally on estimates furnished by cotton ginners for the territories served by their gins. Supplemental information is obtained by others closely associated with cotton culture in their respective areas, such as seed breeders, seed dealers, farmers and county agents. These estimates should serve as reliable guides as to the geographic distribution of various varieties grown throughout the Cotton Belt.

This year's estimates indicate that four general varieties account for over two-thirds of the cotton acreage in the United States. These varieties in order of their relative importance are Stoneville, Deltapine, Acala and Lankart. A percentage distribution of the ten leading general varieties planted in 1967, with comparisons for the four previous years, is presented at the foot of this page. All strains of each particular variety are combined for comparative purposes.

Stoneville remains the leading variety of cotton planted in the United States with 20 percent of the total acreage, the same proportion as a year earlier. Stoneville is the principal variety planted in Arkansas, Mississippi and Missouri.

The next two leading varieties, Deltapine and Acala, each account for about 17 percent of total United States planted acreage. Estimates indicate that acreage planted to Deltapine is down slightly from the previous year while Acala's popularity increased substantially from a year earlier. Deltapine continues to be the leading variety in Arizona, Kentucky and Louisiana. Acala is the predominating variety in California, New Mexico and southwest Texas (Carlsbad and El Paso classing office territories of Texas).

The fourth leading variety planted this year is Lankart, which accounts for 14 percent of the total acreage. This is a slight increase from the previous year and is the highest proportion planted to this variety since 1959.

In the southeastern area of the belt, Carolina Queen remains the leading variety and accounts for 40 percent of the total acreage in that area. Coker ranks second with 34 percent and is the leading variety in the Carolinas. The sharp increase in acreage planted to this variety is due primarily to the rising popularity of the new Coker 413 strain. Dixie King is the third most popular variety accounting for 11 percent of the total acreage in the southeastern states.

In the south central area, Stoneville continues to increase in popularity and accounts for 47 percent of total acreage against 45 percent last year. Deltapine is the second leading variety with 37 percent of 1967 acreage. Dixie King is the third leading variety and accounts for five percent of the total acreage. Dixie King continues to be the principal variety planted in Tennessee.

In the southwestern area, Lankart remains the most prominent variety and accounts for 38 percent of the acreage planted. Paymaster is the second leading variety with 13 percent of the total acreage in this two-state area compared with 12 percent last season. Stoneville continues to be the third most popular variety in 1967 with 13 percent of the total.

In the western area, Acala shows a marked increase over a year earlier and accounts for three-fourths of the total acreage. Acala SJ-1, the leading Acala strain, has largely replaced Acala 4-42 in the San Joaquin Valley of California and represents 87 percent of that state's planted acreage. In Arizona, Hopicala is the most popular Acala while 1517C is the predominating strain in Texas and New Mexico. Deltapine Smooth Leaf ranks second in the western states and is the leading variety in Arizona and the Imperial Valley of California.

Pima S-2 remains the leading variety of American-Egyptian cotton planted in 1967 with 56 percent against 80 percent in 1966. The relatively new Pima strains S-3 and S-4 are fast gaining in popularity with an increase in acreage planted to S-3 in Texas and New Mexico, and a substantial increase in acreage of the S-4 strain in Arizona and California.

Estimated percentage of cotton acreage planted to specified varieties, United States, 1963-1967
